The AutoCAD student community AutoCAD is considered a hobbyist product for many, the result being the need for a community of CAD users to help each other, including in the forum. This community has been described as a hybrid between a user group and a support forum, with each individual posting their questions or information and asking for help or specific answers. The website drew a UK audience in 2001, which reached over 50,000 visitors by 2006. The company has designed some of its own surveys for its customers and

pulled questions directly from the site's listings of job openings, all of which are culled from postings on a number of job boards including Indeed, Glassdoor, Career Builder, Monster and Career Newswire. The company's research shows that job seekers at all levels are more likely to apply for jobs when they have the ability to give an overview of themselves, Seshadri said. "They can self-rate their skills in terms of the likelihood that they will hire a person who fits those skills," he said. Customers are more likely to trust the reviews of people they know, Seshadri said. "If I know you and know you've been to this hotel before, I'm not going to think your review is going to be tainted by your feelings toward the hotel," he said. Indeed offers free online surveys for its customers, such as the one above, which asks job seekers about their experience with a company. "People are willing to spend their time responding to questions and doing their research for free," Seshadri said. Indeed's job a1d647c40b

Field of the Invention The present invention relates to a display device, and more particularly, to a liquid crystal display (LCD) device and a method of fabricating the same. 2. Discussion of the Related Art In general, LCD devices include upper and lower substrates bonded to each other at a predetermined interval and a liquid crystal layer is formed between the upper and lower substrates. When a predetermined voltage is applied to the liquid crystal layer, molecules of the liquid crystal layer are arranged in the same direction. By controlling the voltage applied to the liquid crystal layer, the transmissivity of light is adjusted to display images. Active matrix LCD (AM-LCD) devices are widely used in portable image display devices such as mobile telephones and notebook computers. AM-LCD devices have a high resolution and a high-quality image. A thin film transistor (TFT) is often used as a switching device of an AM-LCD device. An active layer of the TFT is formed of polysilicon or amorphous silicon. A polysilicon active layer has a high field effect mobility and high electron mobility and a threshold voltage is less changed as compared with the active layer of amorphous silicon. However, since the TFT includes the active layer formed of polysilicon, it can be damaged by light. Thus, it is important to shield light incident upon the active layer. FIGS. 1A to 1E are cross-sectional views illustrating a method of fabricating a related art LCD device. As shown in FIG. 1A, a first metal layer 11 and a second metal layer 12 are formed on a transparent substrate 10. The first metal layer 11 and the second metal layer 12 are, for example, made of aluminum. A gate electrode 11a is formed on a gate insulating layer 13 that covers the first metal layer 11 and the second metal layer 12. A gate line. Insulating layer 13 is formed on the gate electrode 11a. The gate electrode 11a and the gate line 13 are formed to intersect
