

SchemeHK is a small and easy to use tool that allows the changing of power schemes with use of user defined hotkeys. This is useful on laptops to switch to high performance before starting a game or other intensive program and switch back to a more power efficient scheme to save battery after you are finished using the application. View online at: The following video shows the use of Visual Studio Add-in Manager to add the SchemeHK Addin to the Tools menu of Visual Studio 2008. The following video shows the use of SchemeHK to switch to High Performance Power Plan. The following video shows how to use the SchemeHK hotkeys to switch to a different power plan. The following video shows how to use SchemeHK to save energy while using various programs. Use this tool to change any Power Scheme. Change Power Plan with the hotkeys. SchemeHK is a small and easy to use tool that allows the changing of power schemes with use of user defined hotkeys. What's New In?

SchemeHK is a small and easy to use tool that allows the changing of power schemes with use of user defined hotkeys. This is useful on laptops to switch to high performance before starting a game or other intensive program and switch back to a more power efficient scheme to save battery after you are finished using the application. Installation: Please unzip SchemeHK to any folder of your choice. Run: On startup, you will be given a menu to choose from the four power schemes that are defined for you. Please note that this does not include the 'Battery' scheme as there is nothing currently in this scheme. Settings: The 'Settings' menu allows you to setup keyboard hotkeys to start SchemeHK and to change from which scheme SchemeHK will be started. General: You can also configure SchemeHK to stay open when you exit and choose whether or not SchemeHK should also close automatically when you have finished using it. Quick Settings: This option allows you to define hotkeys for switching between the power schemes with 1, 2, 3, or 4 hotkeys. Known Issues: There are some known issues with SchemeHK that have been fixed in the latest version. These are: 1. In the past, SchemeHK had two options for auto-scheme. One was to always change to the Battery scheme and the other was to always change to the Performance scheme. This can still be selected but the change to the Battery scheme is now selected by default. 2. If there are many hotkeys defined and SchemeHK has been opened, there can be a delay to create and display the hotkey menu. This will not happen often and is limited to the number of hotkeys defined. 3. SchemeHK does not work correctly with iTunes. 4. Some other games can have issues with SchemeHK. This will be fixed in the next version of SchemeHK. Credits: This was inspired by the following applications: 1. Apple's power schemes 2. Keychain for Power Schemes 3. Switcher for Power Schemes 4. Alt+Tab for Power Schemes Feedback: You can leave feedback for SchemeHK at my Github repository. There is also an example.plist for you to copy and modify. Bug Reports: Please use the following addresses to report any bugs or problems you encounter with SchemeHK: 1. SchemeHK Developers 2. SchemeHK Supporters

System Requirements:

Windows 7 and up. Dual monitors. Bluetooth and stereo speakers. Minimum resolution: 1280 x 1024. Mac OS X and Linux. Portal 2 is a game of two halves. Half-decent PC gamers play Portal games with the full range of Valve's Steamworks suite of tools and services, enabling them to enjoy a range of in-game visual effects, including HDR and stereoscopic 3D. Half-decent PC gamers also play Portal 2 with half
